## What Is Claimed Is:

1	1.	A	method	for	up-converting	an	electromagnetic	signal,	the
2	electromagnetic signal having a first frequency, comprising:								

- (1) gating a bias signal at a rate proportional to the first frequency of the electromagnetic signal to generate a harmonically rich signal having a plurality of harmonics; and
- (2) selecting at least one of said plurality of harmonics as a desired signal having at least a second frequency.
- 2. The method of claim 1, further comprising:
- (3) shaping the electromagnetic signal, resulting in a shaped signal, said shaped signal being a substantially rectangular waveform having a third frequency, said third frequency being proportional to the first frequency, said substantially rectangular waveform further having a period that is an inverse of said third frequency, a pulse width, and a pulse ratio, said pulse ratio being a ratio of said pulse width to said period; and wherein

said bias signal is gated in step (1) at a rate proportional to said third frequency.

- 3. The method of claim 2, wherein said pulse ratio is substantially equal to or less than 0.5.
- 4. The method of claim 1, wherein the electromagnetic signal is modulated.
- 5. The method of claim 1, wherein said bias signal is related to an information signal.
